(Национальный исследовательский университет)**

Факультет: «Информационные технологии и прикладная математика»

Кафедра: 806 «Вычислительная математика и программирование»

Дисциплина: «Объектно-ориентированное программирование»

Лабораторная работа № 8

Тема: Программирование классов на языке C++

Студент: Бронников М. А.

Группа: 80-204

Преподаватель: Чернышов Л.Н.

Дата:

Оценка:

Москва, 2018

1. Постановка задачи

Цель работы : Цель построения аллокатора – минимизация вызова операции malloc. Аллокатор должен выделять большие блоки памяти для хранения фигур и при создании новых фигур-объектов выделять место под объекты в этой памяти.

Алокатор должен хранить списки использованных/свободных блоков. Для хранения списка свободных блоков нужно применять динамическую структуру данных (контейнер 2-го уровня).

Для вызова аллокатора должны быть переопределены оператор new и delete у классов-фигур.

Нельзя использовать:

- Стандартные контейнеры std.

Программа должна позволять:

- Вводить произвольное количество фигур и добавлять их в контейнер.
- Распечатывать содержимое контейнера.
- Удалять фигуры из контейнера.

Вариант:

Контейнер 1-го уровня : массив

Контейнер 2-го уровня : стек

Фигуры : Треугольник, квадрат , прямоугольник.

2. Решения задачи

Для решения задания необходимо написать программу которая будет работать на основе контейнера первого уровня, включая в себя контейнер второго уровня, умные указатели и перегрузки операторов, также я ввёл итерационный вывод фигур, по такому же принципу, как и в предыдущей работе.

3. Руководство по использованию программы

Компиляция программы на windows:

установить mingw, затем запустить в командной строке cmd : g++ *.cpp

затем : a.exe tests.txt

Компиляция программы в linux:

в терминале запустить:

g++ *.cpp

затем : ./a.out tests.txt

При запуске скомпилированного файла запускается диалоговое окно с возможностью выбора действия:

y/n - для создания списка с помощью данных из файла tests.txt или созданию собственного списка

1,2,3)Создание треугольника , квадрата или прямоугольника: ввод сторон и позиции для вставки;

4)Удаление фигур по площади : ввод площади;

5)Удаление фигур по типу : ввод 1, 2 или 3 для удаления всех треугольников , квадратов и прямоугольников соответственно ;

6)Вывод на экран ;

0)Выход из диалогового меню , ведущий к завершению работы программы

.

4. Листинг программы

Figure.cpp

```
#include "Figure.h"
```

```
#include <iostream>
```

```
#include <cstdlib>
```

```

6. Выводы

На мой взгляд работа больше закрепительного характера, позволяет

ещё раз применить, ранее использованные методы, такие как итерацию, ввод фигур их вывод, перегрузку операторов и использование аллокаторов, работа позволила закрепить и расширить навыки использования C++.
